

How to fit your kicking board*

* Registered mark ®

Fitting

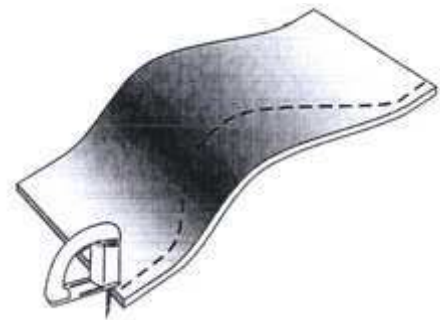

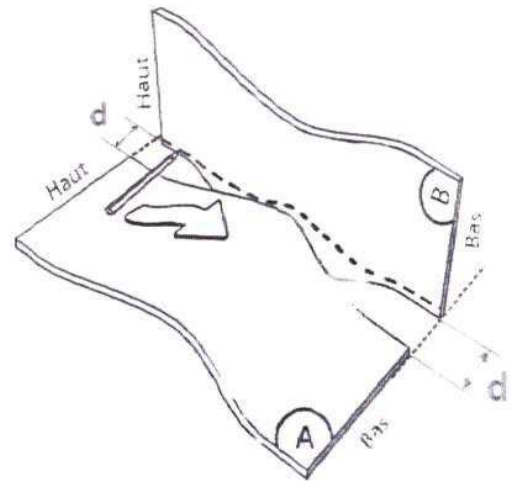

- We advice to fit the kicking board on strips surrounding the arena thanks to 8 fixing bolts per element.
- The kicking boards are usually fitted up to 15 – 25 cm from the ground (in case of fall the rider can find a protection underneath)

Cutting

To cut the angle of the kicking board, please proceed as follows:

- Lay down part A
- Put vertically part B at the right angle from part A in order to respect the same distance "d" at each end.
- With a flat "joiner pencil" lay down your pencil on part A and draw the profile on part B.
- Cut part B into following the layout with a saw.

Proposals

- To protect your kicking boards from moisture, we suggest you to put a painting layer (to be renewed every year).
- If you want to fix kicking boards on the gate, this one has to be opened to outside.
- You also can close the edge of a kick board line with a side profile.
- For a very esthetical finish you can cover the upper edge of the kick-board with a U-profile or an edge banding.
